PTUM Library-Final Supplementary Note

Erdem Esa
Independent Researcher, Istanbul, Turkey

Purpose

This note accompanies the library-final PTUM archive. It replaces an obsolete supplementary file that belonged to a different project. The main manuscript is now self-contained: implementation details and consistency figures are placed in the appendix.

Repository status

The current archive contains manuscript source, compiled PDF, figures, journal class files, and library notes. A public `CLASS/Cobaya` repository should be attached before journal submission if the benchmark numerical claims are to be presented as fully reproducible pipeline results.

Safe claim boundary

PTUM is an effective phenomenological cosmological framework. It is not presented as a UV completion, a solution of the cosmological-constant hierarchy, or a proof that dark matter and dark energy have a unique microscopic origin.

Future reproducibility target

A later submission-ready archive should include: modified `CLASS` source, `Cobaya` YAML files, chains or compressed posterior samples, exact plotting scripts, random seeds, likelihood versions, and a one-command Docker reproduction path.
